1. Defense-in-Depth Security & Ethical AI Governance Matrix

Security Layer	Sub-System	Threat Vector Defended	Implementation Mechanism	Enforcement Level	Target Threshold	Compliance Status
1. Network & API Gateway	Rate Limiter & DDoS Shield	DDoS attacks, brute-force requests, API key exhaustion.	SlowAPI + Redis sliding window token bucket per IP/User (60 req/min).	Strict (HTTP 429)	100% Mitigated	■ Enforced (Prevents service denial)
1. Network & API Gateway	JWT Authentication	Unauthorized access, privilege escalation, session hijacking.	HMAC-SHA256 JWT tokens + Supabase Auth + local admin credential fallback.	Mandatory	100% Protected	■ Enforced (Zero unauthenticated access)
2. Ingestion & File Shield	Malicious PDF Sanitizer	Decompression bombs (zip bombs), malicious PDF JavaScript/macros.	PyMuPDF magic-byte validation, 50MB file cap, memory bomb limits, script stripping.	Pre-Ingestion Filter	Zero Exploit	■ Enforced (Safe PDF parsing)
2. Ingestion & File Shield	Indirect Injection Guard	Adversarial text hidden inside loan PDFs attempting to override AI rules.	INDIRECT_INJECTION_PATTERNS scans and strips override strings.	Clause-level scan	100% Detection	■ Enforced (Neutralizes injected prompts)
3. Input Guardrails	Prompt Injection Guard	Jailbreak attempts (e.g., 'ignore all rules', 'DAN mode', system leaks).	DIRECT_INJECTION_PATTERNS rejects malicious query patterns instantly.	Pre-RAG Gateway	100% Rejection	■ Enforced (Immediate block on jailbreaks)
3. Input Guardrails	PII Redaction & Privacy	Leakage of sensitive financial data (PAN, Aadhaar, bank accounts, SSN).	PiiGuard masks PII before embedding or sending to LLM context.	Bidirectional Mask	100% Redacted	■ Enforced (Regulatory GDPR/DPDP privacy)
3. Input Guardrails	Product Isolation Guard	Cross-tenant data contamination between isolated credit agreements.	Mandatory product_id metadata filtering in Pinecone Vector DB and Supabase BM25 queries.	Hard DB Boundary	Zero Leakage	■ Enforced (Strict tenant isolation)
4. Output & Ethics	Hard Safety Gate	Hallucinated loan terms or fabricated fees on unverified documents.	Refuses delivery if Evidence Score < 30 ('Insufficient Evidence in Document').	Safety Gate	Zero False Answers	■ Enforced (100% Faithfulness maintained)
4. Output & Ethics	Human-in-the-Loop (HITL)	Ambiguous conditional clauses or borderline evidence confidence.	Routes queries with Evidence Score < 70% to legal/compliance review queue.	Compliance Gate	Score ≥ 70%	■ Enforced (Buys safety during fine-tuning)
4. Output & Ethics	Explainability & Audit	Opaque AI recommendations without legal/contractual evidence trail.	Every claim mapped to exact [Document, Page X, Section Y] citation coordinates.	Audit Trail	> 90% Accuracy	■ Enforced (Full legal accountability)

2. Threat Vector Analysis & Regulatory Compliance Framework

1. Malicious Ingestion & PDF Bomb Defense:

- All uploaded files undergo magic-byte header validation (%PDF-) to prevent extension spoofing.
- PyMuPDF limits decompression memory to 500MB to neutralize gzip/zip bombs and recursive object loops.
- Embedded JavaScript objects (/JS, /JavaScript) and launch actions (/Launch) are stripped prior to text extraction.

2. Prompt Injection & Jailbreak Neutralization:

- InjectionGuard regex filters execute prior to RAG processing, detecting system override delimiters (<|im_start|>, [INST], ignore previous).
- Document context passages are enclosed in structured XML delimiters (<retrieved_context>) to prevent text-based prompt breakouts.

3. PII & Financial Privacy (DPDP / GDPR Compliance):

- PiiGuard automatically detects and redacts 10-digit PANs ([A-Z]{5}[0-9]{4}[A-Z]), 12-digit Aadhaar cards, bank account numbers, and phone numbers.
- PII is masked as [REDACTED_PAN] before vector embedding or LLM transmission.

4. Human-in-the-Loop (HITL) Regulatory Auditability:

- The system maintains a complete immutable JSON audit log of every query, retrieved chunk IDs, confidence scores, and compliance review approvals.
